

## **Full Stack Drupal Developer JD**

Below is the high-level JD we received from the Client:

1. Must be very proactive - meaning, Primacy expects the team member to come up with a solution/workaround instead of Primacy giving a solution to implement.
2. Should have a consultative approach and need very less hand-holding.
3. Able to do context-switching between projects.
4. Performance considerations. For frontend scalability considerations (e.g. diff device sizes, knowledge of JS the drupal way, etc.)
5. Able to handle a project independently/single-handedly (hence requires both frontend & backend knowledge)

Technical must-haves:

Since almost all their projects are built on zensource, they must have a good understanding of modules used by zensource/dojo like:

1. layout builder (able to build custom layouts),
2. Paragraphs
3. Migrations (upgrade from d7 to d9, CSV, JSON migrations)
4. Drush command scripts/batch (again a performance requirement)
5. Other standard modules like views, blocks, etc.
6. Knowledge of writing JS - vanilla js and JQuery, CSS - box model, flex model, responsive designs, CSS animations
7. Sass is a must
8. Basis ReactJS
9. Knowledge of npm required to run tasks like gulp and grunt
10. DevOps (setup pantheon, Code Deployment, CI-integration, Jenkins, etc.)
